

ABSTRACT OF THE DISCLOSURE

A communications method and communications device including a memory adapted to store a profile of a user, wherein the profile contains predetermined attributes and requirements of the user, a transceiver adapted to transmit information relating to the requirements to a compatible device and receive information relating to requirements of the compatible device, a controller adapted to register a match between the device and the compatible device, only when the attributes match the requirements of the compatible device, and a user alert adapted to alert a user when the controller has established that a match has been made. The transceiver is adapted to transmit a first match signal to the compatible device when the controller has established that a match has been made. The device does not need to receive information relating to attributes of the compatible device, in order to register a match with the compatible device.
